PROPOSAL · BIKE RIDES · DROP-OFF

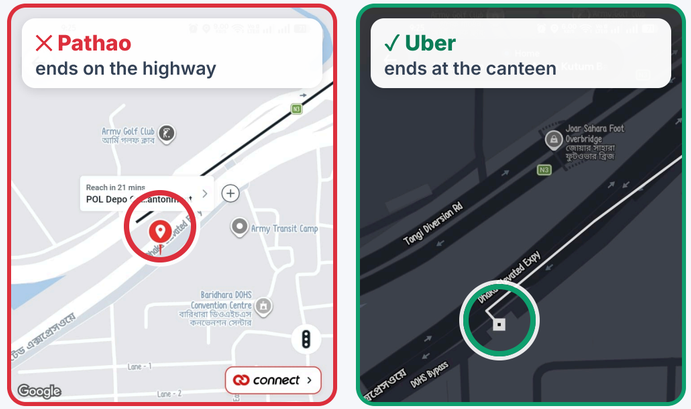

Syed Safwat Sameer
Product Owner · 27 Oct 2026

The pin is right. The ride ends on the wrong road.

Fix the last 100 metres and **stop losing daily commuters to Uber.**

1 THE MOMENT

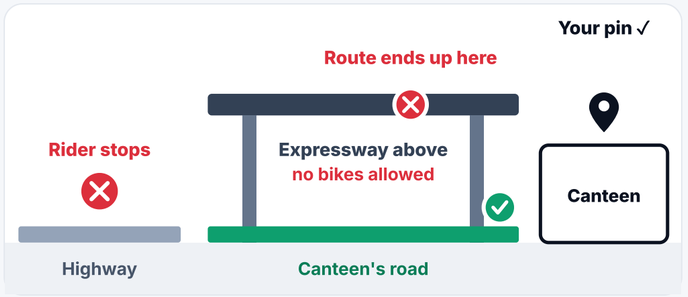

I pin my office canteen. The rider stops across the highway.

About 1 in 2 of my weekday trips. Same place, same time.

2 THE BIGGER CAUSE

The pin marks the place. Nothing marks where to stop.

Under flyovers · Across a divider · Back-road entrances · Big campuses

Same gap wherever the **place and the stopping point differ**. Better GPS won't fix it: the pin is already right.

3 THE FIX: SMART DROP-OFF

Route to the drop-off point, not the pin.

Learn each place's drop-off point
From past trips that ended well.

Your landmark, said once
Instead of directing every rider.

Rider gets both before accepting
No arguing at the turn.

THE RIDER'S RIDE REQUEST

Drop-off point: canteen gate, road under the expressway

Landmark: "Turn left at Shewra Bottola, small road under the expressway."

Uses data we have
Where every trip ends, plus "right spot" taps.

Proven idea
Ride apps already suggest pickup spots from past trips.

Easy to measure
How far rides end from the drop-off point.

THE ASK

Approve a 4-week pilot in Dhaka

First, size the problem from trip logs.

Sources: my own trips and screenshots (9:25 a.m.) · road data © OpenStreetMap · routes: OSRM. "1 in 2" is my own observation.
